

### Introduction

## High Current Flow with Low Insertion Force

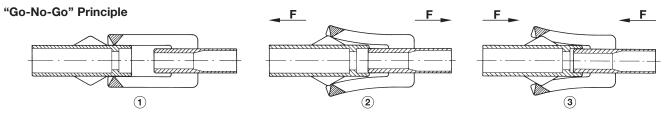

#### **Product Features**

- All Positive Mate housings include a secondary contact retention feature
- Polarization is provided
- Rounded corners on housings prevent injuries while connection the housings
- Wire size range of AWG 20 to AWG 10 allows high current capacity of up to 30 ampere per contact
- Application tooling, ranging from hand tools to fully-automatic machines is available

In an effort to overcome the problems arising from the careless mating of connectors during assembly, the Positive Mate connector is designed so that a condition of partial engagement is impossible. The moulded connector housings incorporate an integral latching device, called the "Go-NoGo" principle.

This latching device utilises the spring characteristics of the nylon material to provide a positively mated connection – or no connection at all. If the spring latch is not locked when assembled, the two connector housings will fail to mate. Consequently, the contacts are disengaged and an open circuit exists.

Due to the insertion force required for the "Go-No-Go" function, the max. no of pos. is limited to 10 per housing. The box-type contact has a special construction with an internal double-spring which mates with the tab. This allows a high current flow with simultaneous low insertion force and constant closed linkage between the contacts.

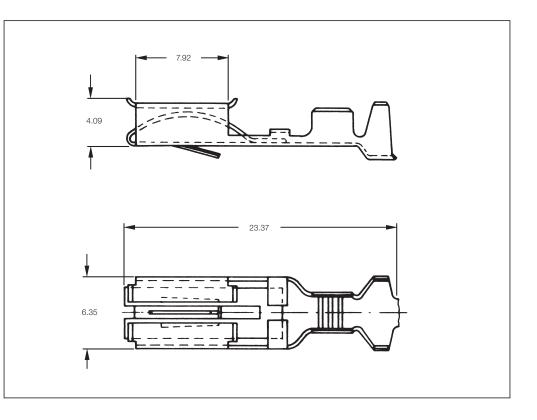

① The receptacle housing possesses two locking lances,

- (2) which are pushed apart when slid over the ramps of the tab housing. The elastic properties of polyamide material allow the locking lances to return to their starting positions. Force F is the result, which tries to separarte the housing again.
- ③ Once the locking lance is over the top of the ramp force F changes direction, pulling the housing halves together.
